

Ann Lake Campground

Imagine my joy when, having already decided to make a website for the campground at which my wife and I are camphosts in the summer, I saw that the NuCamp practice site was for – a campground. Yay!

I am building this for the sake of the admin data aspect, by which hypothetical campground owners will keep site utilization records and the nightly walk-around census can be taken with a phone app as opposed to pen and paper. We will actually use this app this summer.

The promotional portion of the site is pure fantasy and satire. The reality of the place is less attractive.

Design and Implementation of the data aspects will wait until later. For the front end I just went exploring and tried to learn as much as possible. Please note the work is in progress. I wouldn't call it commercially viable.

I found a news ticker example on codepen and adapted it. Pretty cheesy, but fun and instructive.

Mobile-first means to me a one page scrolling site, especially in anticipation of React.

Future: Detailed reservation form, reports, and that nightly census app which will include provision for notes and photos.

Learned: Quite a lot about SCSS, CSS and Bootstrap 5, especially how not to use jQuery. We open the modal log-in w/o js.

Shortcomings: It's just a skeleton at present. I used the time to wander around documentation at the expense of beauty and polish.
